

# Act Report

In this report I took data from the twitter account “WeRateDogs” which tweets about dogs types and rate them, the rate are from 10 points but most of times they give thing more than this like 12/10, first I did gather the data then assess the data then I cleaned the data, then I analyze the data.

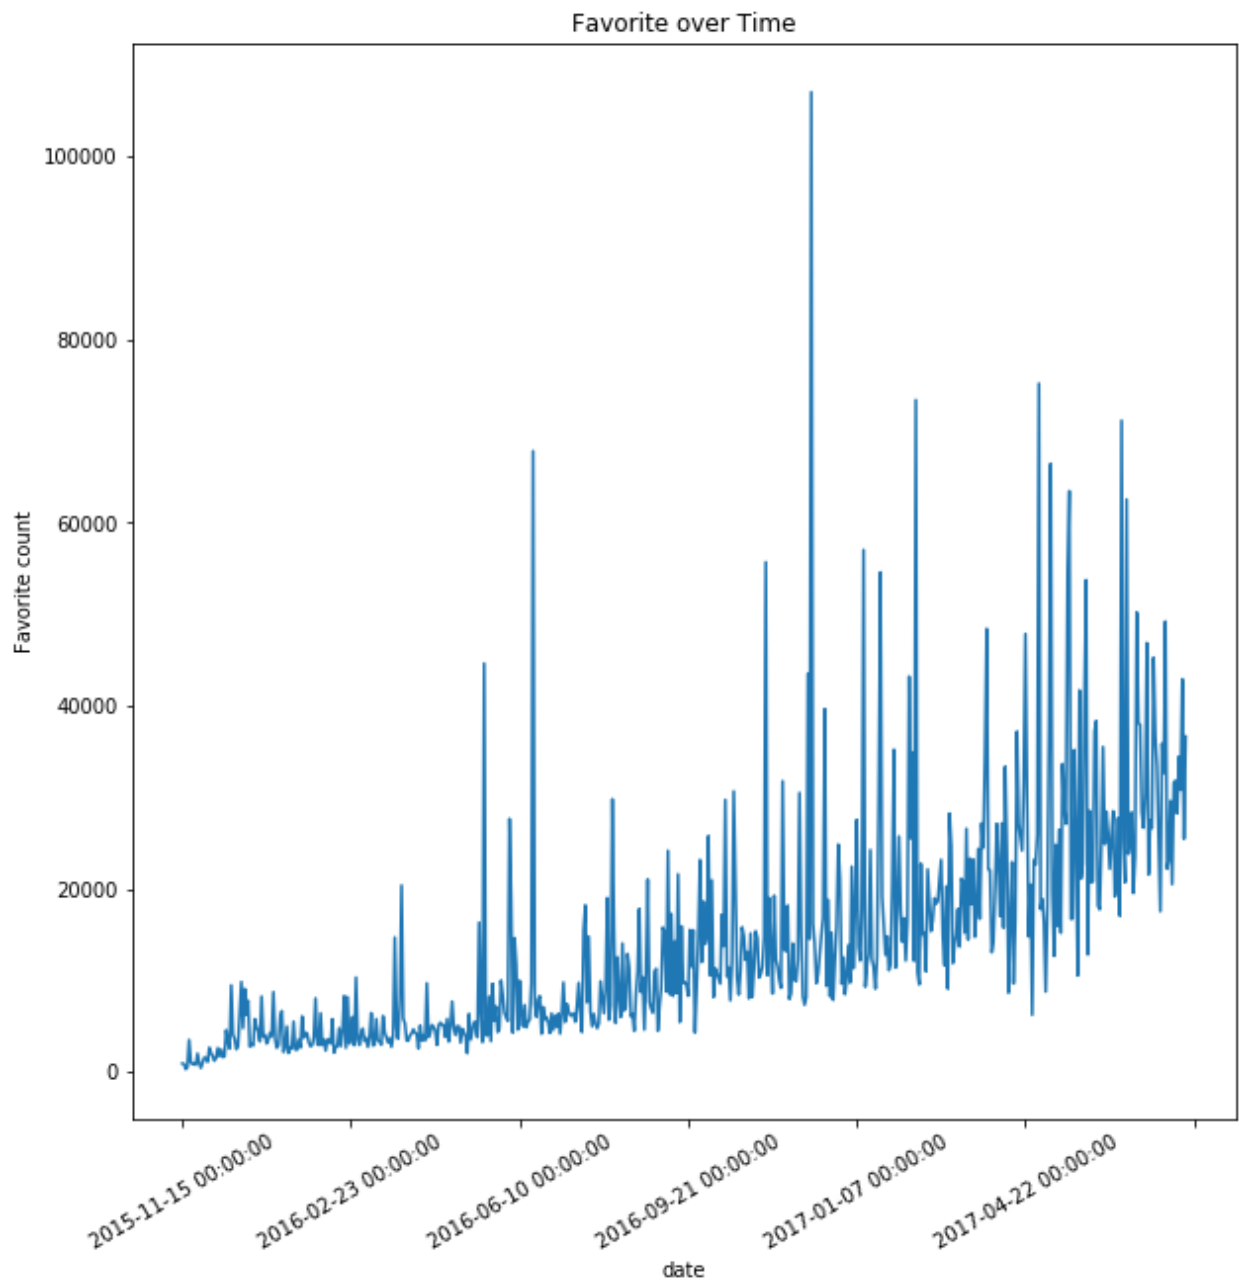

While analyzing the data I discovered that most tweets have around 0-10000 retweets and the number favorites usually be more than the number of retweets.

And I also notice that the most sources of tweets are Official iPhone twitter app, and there is a very few tweets from others sources like web client and TweetDeck.

I also checked if the number of favorites for tweets did increase over time and it appear to be increasing.

And lastly I checked which type of dogs does get the most number of favorite in this account's tweets, and it appears to be that floofer, dogoo and puppo have close number of favorites while pupper have less favorites. and the tweet with the most number of favorite is for puppo.
